

IN THE CLAIMS

Please amend the claims as follows:

1. (original) Demodulator arranged to demodulate a first signal with the aid of a second signal, the demodulator comprising:

- a first bandpass (30) filter arranged to recover the first signal (36) from a received signal (10) ; and
- a second bandpass filter (32) arranged to recover the second signal (30) from the received signal (10);

in which the passband of the second bandpass filter (32) is substantially narrower than the passband of the first bandpass filter (30).

2. (original) Demodulator according to claim 1, wherein the demodulator comprises compensation means (40,50) for compensating phase error between the recovered first (36) and second (38) signals.

3. (original) Demodulator according to claim 2, wherein the compensation means comprises a delay element (4) that is arranged to delay the recovered first signal (36).

4. (original) Demodulator according to claim 2, wherein the compensation means comprises a phase shifter (50) that is arranged

to shift a phase of the recovered first signal (36), the phase shift being dependent upon the phase difference between the recovered second signal (38) and a reference signal (51).

5. (original) Demodulator according to claim 4, wherein the compensation means comprises a selector (31) that is arranged to select the reference signal (51) from at least two sources.

6. (original) Demodulator according to claim 5, wherein the selector (31) is a programmable selector.

7. (currently amended) Demodulator according to claim ~~5 or 6~~, wherein one of the at least two sources is a demodulated first signal (18).

8. (currently amended) Demodulator according to claim ~~5 or 6~~, wherein one of the at least two source is an image of a demodulated first signal (18) which is stored in memory means (35).

9. (original) Demodulator according to claim 8 wherein, the memory means (35) comprises an analogue to digital converter arranged to provide a digital image of the demodulated first signal.

10. (currently amended) Demodulator according to ~~one of the~~
~~previous claims~~claim 1 wherein the demodulator further comprises a
phase locked loop (60) for stabilizing the recovered second signal
(38).

11. (currently amended) Demodulator according to ~~one of the~~
~~previous claims~~claim 1 wherein the recovered second signal (38) is
used for frequency down converting at least a third signal (73).

12. (currently amended) Apparatus (88) comprising a demodulator
(82), the demodulator being arranged to demodulate a first signal
(36) with the aid of a second signal (38), the demodulator
comprising:

- a first bandpass filter (30) arranged to recover the first
signal (36) from a received signal (10); and
- a second bandpass filter (32) arranged to recover the second
signal (38) from the received signal (10);

in which the passband of the second bandpass filter (32) is
substantially narrower than the passband of the first bandpass
filter (30).

13. (currently amended) Method for demodulating a first signal
with the aid of a second signal the method comprising the steps of:

- using a first bandpass filter (30) for recovering the first

signal (36) from a received signal (10);

- using a second bandpass filter (32) having a substantially narrower passband than the first bandpass filter (30), for recovering the second signal (38) from the received signal (10).
